Education

University of British Columbia *Vancouver, BC*
Bachelor of Applied Science in Computer Engineering *Expected May 2028*
- Presidential Scholars Award ($60,000), Dean's Honour List, available 4 or 8 months, CGPA: 84.7%.

Technical Skills

Protocols: CAN/CAN-FD, MQTT, Bluetooth, UART, SPI, I2C, Modbus, NMEA 2000, RV-C, PCIe
Languages: C/C++, Python, Shell, SQL
Tools: Linux/Unix, Logic Analyzers, Oscilloscopes, BLE Sniffers, PCAN-USB, Git

Experience

Hardware Verification Engineering Intern *Vancouver, BC*
AMD *Sept 2026 – Present*
- Contributing to verification of the IOHUB subsystem for next-generation AMD processor architectures.
- Verifying IOMMU L1 cache behavior using UVM in a constrained-random testbench.
- Expanded the constrained-random testbench to cover corner cases and improve functional coverage.

Software Test / Embedded Development Co-op *Burnaby, BC*
Xantrex *May 2024 – Aug 2025*
- Developed an object-oriented, multi-threaded, non-blocking C++ firmware architecture on Linux-based Raspberry Pi gateways to parse RV-C CAN frames from STM32 devices and publish structured messages over MQTT.
- Extended firmware support to NMEA 2000 and a proprietary UART battery communication protocol.
- Troubleshot CAN/BLE communication faults on embedded inverter and charger platforms using oscilloscopes, logic analyzers, PCAN-USB adapters, and BLE sniffers.
- Built Python Hardware-in-the-Loop (HIL) CAN and UART simulators to run 100+ verification tests on the Raspberry Pi gateway, validating edge cases and stress-testing real-time performance.
- Achieved 7× device capacity, 90% lower CPU usage, and ∼2 s lower latency after the C++ migration.
- Replaced a ∼60k-line Python implementation with the C++ architecture.

Firmware / Embedded Systems Developer *Vancouver, BC*
UBC Rover *Sept 2023 – July 2026*
- Led migration to a CAN-FD architecture using Moteus r4.11 controllers and BLDC motors for closed-loop torque control and higher bandwidth.
- Interfaced an Intel NUC (onboard PC) with SocketCAN and bridged data to ROS.
- Led a team of 3 engineers building a distributed embedded control system across ESP32 (FreeRTOS), STM32, Arduino, and TI LaunchPad MCUs over SPI/I2C.
- Aggregated inputs from switches, buttons, potentiometers, encoders, and joysticks and streamed data over UART.
- Developed a 16-channel telemetry system on a TI C2000 (LAUNCHXL-F28069M) using ePWM-triggered ADC interrupts, streaming GPIO/ADC data over SCI/UART.

Undergraduate Research Assistant *Vancouver, BC*
UBC Electrical and Computer Engineering — Supervisor: Dr. Lutz Lampe *May 2026 – Sept 2026*
- Researching battery-less platforms for the Internet of Underwater Things via simulation of piezoelectric interface circuits.
- Optimizing power extraction of piezoelectric energy harvesting interface circuits (SEH, SSHI, SECE) through LTspice and Simulink/Simscape simulation.

Projects

OnlyVim | *Python, Linux, D-Bus, RPC*
- Developing a Linux daemon enabling global text editing with Neovim keybindings via keyboard remapping, D-Bus, and RPC interfaces.
- Designed low-latency event handling and Linux IPC for system-wide integration across applications.

Multimodal AI Messenger | *Node.js, Express, WebSocket, MongoDB, Gemini API*
- Built a concurrent full-stack messaging platform with Node.js, MongoDB, and WebSockets for real-time updates.
